Overview

Even though I did not manage to complete all the features I had planned for my app, I am quite happy with the amount of progress I've made over the course of building it. I managed to learn more about docker and redux, as well as creating a CI/CD pipeline using Github Actions. I deployed my app on a digital ocean droplet, using docker-compose for the Rails backend api and NGINX for the react frontend.

I felt like I could improve more on the frontend design and UI/UX. Currently the app is quite minimalist as I was working more on the backend and devops side of things.

User Manual

1. Log into the app or Sign Up if you don't have an account
2. Create new todos by typing into the add todo bar at the top of the page
3. Each todo can be assigned a date and category using the respective selectors
4. Each todo can be marked as completed, after which it is removed from the list.
5. New categories can be added via the category selector.
